Called from BMC where pt went with cp. No evidence cardiac problems per there eval. Noted to have a sinus bradycardia at 48. Not light headed. I had refilled his metoprolol last week which by reviewing the record he wasn't using since would have run out. Likely cause of slow pulse. They will reduce to 12.5mg and he will f/u in 2 weeks.

### Progress Notes

#### SYSTEM - Signed

James L Rollins came into office c/o foot pain/burning sensation, and lt lower lip pain. No hx trauma. No f.c. No cp, sob, doe.

Current medications, allergies and problem list reviewed.

PE: BM in nad. Vitals as above. HENT exam reveals a canker sore on lt lower lip. Feet with some scaling and peeling with small amt cracking at base of 4th toe on lt. No redness, warmth, drainage.

#### imp/plan:

1. Canker sore. To use sx rx with abesol, salt water washes and f/u further problems.
2. Foot sx possibly fungal, possibly contact derm as wearing a plastic type sandal. Will try rx with keeping feet dry, lotrimin, deserhex powder and f/u if not improving.

Pt agrees with plan.

This is a 51 year old man with elevated creat was 1.4 to 1.47 in 1995. Urinalysis have shown no blood or protein. CT in 2005 kidneys unremarkable. No ultrasound. Most recent creat 1.2. C/o foul smelling urine.

PMH MI, diabetes X 2 years, htn, hypercholesterolemia

MEDS: Simvastatin  
Lisinopril 10 mg

Pertinent labs (from:may):

Creat 1.2  
eGFR  
K 4.2  
BUN  
HC03  
Pth 43  
Vit D 28  
Ca  
Phos  
Hb/Hct 15.1  
Fe Sat 31

PE

BP 134/84 | 140/90 on repeat  
Chest clear  
Cor reg

IMP

IMP:

CKD though not clear which stage given recent creat. Doing well. Issues as follows:

1. BP-would still aim for 130/80. Will increase Lisinopril to 20. Check labs in one week.
  2. Volume status good.
  3. renal function stable
  4. Anemia OK
  5. PTH and Vit D OK
  6. electrolytes
- Will check urinalysis.

SYSTEM Added

Added by: DIAMOND MD, ERIC N. on: 5/20/2008 12:11:06 PM

James L Rollins comes in today, had an EKG as requested than left the office to walk outside. Returned at end of appt time. He is here because 1. Felt urine was a darker yellow than usual without frequency, urgency, dysuria. Also, 2. States was assaulted 1 week ago by a woman who hit him in the head. Also, having a lot of home stress, his son tried to beat him up and he is separating from his wife. Thinks son may go to jail for this assault.

On 5/13 was T+R from mgh with cp, r/o MI.

He wants to have knee surgery but has a sig cardiac hx and did not f/u as needed with cardiology. Needs stress mibi prior to clearance and cardiology eval as well. This was ordered today.

Current medications, allergies and problem list reviewed.

PE: wdown bm in nad. Vitals as above. Heart: rrr without murm, gallops or rubs. Lungs clear to P & A.

EKG: NSR @ 55 without acute changes. 1st deg av block. C/t old ekg 5/1/08, without sig change.

imp/plan: He states he's using meds as rx'd. Will order stress mibi and than will need cardiology f/u. Labs and urine studies ordered as well. Pt agrees with plan.

Pt. called at 4:20 AM in response to a voice mail he rec'd from Ruth Pierre on 5/16. He states he just got the message now. I informed him it was in response to a message he has left regarding his hospitalization. He was advised that if it was a critical issue that needed to be dealt with staff would have been instructed to continue to try to reach him. Pt. denies chest pain/sob, dizziness or diaphoresis. He did state that he has urinary urgency. He denies pain or burning with urination. Denies hematuria, flank pain, fever or chills. Was offered an ED visit but declined. Advised to call urgent care in the AM for an appointment or call back to clinical telecom sooner if cp/sob, diaphoresis or dizziness develops or if he develops pain with urination, hematuria, flank pain, fever or chills. Pt. agrees.

Tobacco Use: Never  
Alcohol Use: No

EXAM:

Vital signs as above. Body Mass Index is 34.37  
It is based on height of 6' 1" and weight of 260 lbs on 5/1/2008.  
Appears overweight but otherwise well  
Skin: Normal with no significant lesions noted.  
Eyes: PERRL, EOM intact.  
Ears: TM's clear.  
Pharynx: Without lesions or exudate.  
Neck: Supple, no JVD. No thyromegaly.  
Nodes: No cervical or supraclavicular adenopathy.  
Chest: Clear to auscultation.  
Breasts: No masses.  
Cardiac: Regular rhythm without murmurs or gallops.  
Abdomen: Bowel sounds normal, soft, without tenderness or organomegaly.  
Genitalia: Testes normal; no hernia.  
Rectal: No masses, prostate normal, stool guaiac positive.  
Extremities: No edema.  
Neuro: non-focal.

PLAN:

Health screening tests:  
--as ordered below  
Diagnostic tests:  
--as ordered below  
Colorectal screening:  
--HM reviewed; updated as needed  
--colonoscopy ordered after disc. of alternatives  
Immunization Update: given Tdap  
Counseling:  
--drug/alcohol/tobacco assessment and/or review of history done  
--weight management issues discussed  
--daily multivitamin advised

--aspirin 81mg daily advised

FAMILY HISTORY COLON CANCER (V16.0): Mr. Rollins had an attempted colonoscopy in 5/05. Note reads Colonoscopy attempted to screen for colon cancer  
Versed 3 Fent 75

Formed stool in rectum and sigmoid - procedure aborted.

Need to reschedule. He has not had one. Stool gu +. Occ abd pain/gas. This was reordered to be done. Importance stressed to pt. He agrees with plan.

HYPERCHOLESTEROLEMIA (272.0): No c/o myalgia on current dose of zocor.

CHOL 162 01/31/2008  
HDL 37 01/31/2008  
LDL 87 01/31/2008  
TRIG 189 01/31/2008

Will continue rx and repeat testing today.

CORONARY ARTERY DISEASE, UNSPE (414.00): James L Rollins was seen at BMC in 11/5/07 with burning cp, SOB, and sweats after 1-2 mile walk. No radiation. Pain control achieved with 2 doses IV MSO4 and sl nitro x 2. EKG showed NSR 65  
He ruled in for a NSTEMI with elevation in CK CKMB, Troponin I. Cardiac cath was done which showed moderate branch vessel disease only with 50% ostial ramus, RCA 70% 2nd acute marginal. and no significant disease the the major coronary arteries. Stenting was not indicated. EF 55%.

D/c meds ASA 81mg, lisinopril 10mg, zocor 80mg, ntg prn. He was instructed to f/u in about a month. He did not take his d/c medications.

He returned to his usual activity, which included playing basketball. He was admitted on 11/18/07 to the Brigham after he developed discomfort playing basketball. In the emergency room, his EKG showed no significant ST-T abnormalities, and though his TNI was again slightly positive, it peaked at 1.59 and then fell to 1.39 when last checked. Because of the positivity of his troponin and the prior history of his recent non-ST elevation MI, he was taken back to the cath lab. His cath revealed no significant occlusive disease. There was some plaque in the left main coronary and perhaps the proximal LAD. As described from the Boston City, there was a 50% lesion in 1 of the marginal vessels of the RCA. However, the cath demonstrated some anterior hypokinesis and somewhat delayed filling of the LAD, suggestive of some form of myocardial process. In discussion with Dr. Andy Eisenhauer, he raised the question of whether or not this was some form of myocarditis affecting flow because of its diffuse effect on the myocardium. The patient was observed following his cardiac catheterization and remained comfortable. An echocardiogram was obtained, which showed an ejection fraction of 60% with no significant valvular disease and no observed wall motion abnormalities despite the findings on the cardiac catheterization. It was felt that following recovery, it might be beneficial to follow-up these studies with a MIBI. It was also felt that there might be some diagnostic advantage to an MRI of his myocardium, but none of those procedures seemed indicated in the moment and given his state of comfort and clinical stability, he was discharged to follow-up in cardiology on 11/29/07 with me.

His discharge medications are aspirin 325 mg a day, lisinopril 10

mg a day, Toprol-XL 25 mg a day, simvastatin 80 mg at bedtime, and nitroglycerin 0.4 mg SL p.r.n. His discharge diagnosis was possible viral myocarditis or some other form of myocarditis, as well as nonocclusive coronary artery disease.

He again did not do any f/u. He did have some other ED visits for non related issues (mva, s.t.).

EKG: NSR @ 58 without acute changes. Boarderline 1st degree AV block. c/t old ekg of 11/30/07, without sig change.

I will have him f/u with cardiology for further testing as indicated prior to clearance for surgery. Importance of f/u and further assessment stressed.

#### RENAL INSUFFIC (593.9):

He was found to have a sl elevated creatinine and nephrology evaluated him on 1/31/08. Their assessment was CKD class 3. Etiology is not known but he clearly has been stable for many years. I will check urinalysis to assess for hem and protein. I will also check ultrasound, though no gross deformity seen on CT. I will check for sequelae of CKD and I will see him in followup. He is already on ACEI and BP is well controlled. He is to f/u with them 6/5/08.

Total visit length for hx, physical and discussion: 50 minutes  
More than 1/2 in discussion.

**Progress Notes**

**SYSTEM Signed**

James L Rollins is a 51 yrs. old male who has been seen in physical therapy since 03/24/08 for treatment of Medial collateral ligament tear/medial meniscus tear/chondromalacia patella of right knee. Pt was referred by Dr.Bley and has attended 7 of 8 scheduled appointments. Pt reports that his ROM/Strength have improved but pain is still present in his right knee. He is scheduled to have his right knee surgery on 05/08/08. He was advised to schedule an appointment for a PT evaluation one week after his surgery.

**Examination:**

ROM- 120 deg of flexion in right knee

Strength- 4/5

Functional Limitations- continues to have some limitations. He is scheduled to have his right knee surgery on 05/08/08.

**Assessment:**

Pt has made excellent gains with PT treatment. Pt has met long term goals set at initial evaluation. Pt is independent with home exercise program.

Discharge Goal: Independent with home exercises.

**Plan:**

Pt is D/C from physical therapy after teaching home exercises and a session of e-stim for right knee region. Instructed Pt to continue with HEP and telephone with any questions. A copy of this plan is being sent to the referring clinician. If there are any questions to the above plan, the referring clinician should contact me directly at X 47155.

**Document Text**

**PRINCIPAL DIAGNOSES:**

1. Medial meniscal tear.
2. MCL tear.

**CLINICAL HISTORY:** James Rollins is a very pleasant 51-year-old male here for followup. He had a fall in which he tore his medial meniscus and MCL. He has been wearing a hinged knee brace subsequently since the injury and reports that he feels some returning stability; however, he is clearly having mechanical symptoms in his knee, worse with pivoting, twisting or squatting. He has completed a formal course of physical therapy without improvement in his symptoms. He does get a catching or giving out sensation in the knee with flexing and extending his knee.

**PHYSICAL EXAMINATION:** On clinical examination, he has trace effusion present. He does have evidence of a mild effusion. His Lachman and posterior drawer are negative. He has no varus valgus instability. He does have significant medial joint line tenderness. He has trace amount of discomfort to valgus stress,

but otherwise good stability, both at 0 and 30 degrees.  
Patellofemoral joint, otherwise appears unremarkable.

ASSESSMENT AND PLAN: I reviewed with the patient the findings on his MRI, the evidence of meniscal tear and in light of his persistent symptoms; I have recommended that he undergo partial meniscectomy. He appears to have clinically healed his MCL tear and in light of this, I think a simple partial meniscectomy will go a long way toward improving some of his symptoms. He is in concurrence. I have referred him to Sarah Sayeed, my surgical scheduler to obtain a mutually convenient surgery date. He will return to see me p.r.n.

Mr.Rollins reported that his right knee pain is slightly less during rest and ambulation and that he was compliant with the exercises taught during the last session. He stated that he did bicycling for few miles yesterday.

Today's treatment included therapeutic exercises (x15mins) comprising of QS, SAQ SLR, LAQ, hamstrings curls in standing (15reps each with a 5-sec hold), ROM exercises, stepping up and down a 6"high stool(x10reps) & stationary cycling x8mins(could perform a full circle of pedalling today) AND e-stim covering medial collat lig region, patellar tendon, and lateral joint line. His right knee ROM was 0 to 110 degrees(measured in supine). His right knee ROM fluctuates during different sessions of therapy and patient reports of pain when attempting to flex the knee beyond the available range. There was no edema present in the knee today. He was advised to continue the exercises within pain limits.

Will continue therapy per plan of care as outlined in the PT evaluation dated 03/24/08.

Initial Physical Therapy Evaluation

James Rollins is a 51 yrs. old male referred to Physical Therapy by Dr. Bley with a diagnosis of Medial collateral ligament tear/medial meniscus tear/chondromalacia patella of right knee for evaluation and treatment.

HCI: Reports of pain in his right knee for the past 2 months following a fall. Sitting with the knee flexed, walking > short distances(>30 mins), getting out of the car, ascending and descending of stairs are difficult and painful for him to perform. Rest relieves pain to some extent. He does not want to take pain meds for fear of getting addicted to the meds. Patient was apprehensive of the possible surgery he might need. Does not do regular exercises or recreational sports. Rates his pain at 8/10 on the pain scale.

PMH/Co-morbidity: Please refer to the chart.  
Allergies: Please refer to the chart

Diagnostic Tests: MRI of right knee done on 02/03/08 at MGH: Tear of posterior horn of body of medial meniscus; Full thickness tear of medial collat. lig; cartilagenous changes of medial tibio-femoral and patellofemoral compartments; Ruptured small Baker's cyst.

Medications: Please refer to the chart  
Occupation/Activities: He was a car salesman and presently he does not work.

Patient Goals: Wants to be pain free and perform his functional tasks optimally with minimal or no pain.

Examination:  
Observation: A healthy looking pleasant male with concerns about his present pain.  
Gait: An antalgic pattern of gait.  
Balance: WFL  
Posture: WFL  
ROM: AROM (include movement pattern) ROM of right knee 0 to 125 degrees of flexion.  
PROM/Flexibility (include end feel) Same as AROM  
Joint Play: WFL  
MMT: Weakness in right VMO and quads/hamstrings: grossly 3 to 3+ /5;

Palpation: Mild warmth around the right knee joint; tenderness over the medial collateral ligament at its femoral attachment and at the medial joint line.  
Anthropomorphic measurements: WFL  
Neurological/Sensory testing: WFL  
Special Tests: Valgus/varus stress tests are positive; Ant/Post drawer is negative; McMurray's test is positive for medial meniscus pathology. Patellar compression test is positive. Clarke's sign is positive indicating patello femoral pathology in both knees. Bilateral hamstrings tightness present.

Functional Limitations: Sitting with the knee flexed, walking > short distances(>30 mins), getting out of the car, ascending and descending of stairs are difficult and painful for him to perform.

Interventions today consisted of: Patient education on today's findings and PT role, teaching of exercises to strengthen right quads muscles (QS, SAQ, SLR,). Stretching of hamstrings in long sitting and discussion on Rx plan and goals.

Assessment: Upon PT evaluation pt. found to have signs and symptoms consistent with Medial collateral ligament tear/medial meniscus tear/chondromalacia patella of right knee. Pt presents with the following impairments and functional limitations as above:

- Pain over the medial collateral ligament at its femoral attachment and at the medial joint line in right knee.
- Tightness in both hamstrings
- Decreased strength in right VMO/quads and hamstrings

Short terms goals (2-4 weeks of PT intervention):

1. Will have decreased pain in right knee to 4/10
2. Decreased tightness in both hamstrings
3. Will have increased strength in right VMO/quads and hamstrings to WFL

Long term goals (4-8 weeks of PT intervention):

1. Will have decreased pain in right knee to 2/10

2. Will perform his regular tasks without pain or discomfort.
3. Will be independent with home exercises

Discharge Goals (pt to reach after discharge): Will be independent with home exercises

Prognosis: Pt has good potential to reach above stated goals secondary to current level of function.

Discussed PT findings and plan of care with patient, patient agrees to the below stated physical therapy treatment program. Pt encouraged to verify insurance benefits prior to commencing treatment. Pt's insurance coverage is HPHC.

Plan: Pt to be seen 2x per week for 8 weeks with a reassessment at 4 weeks for an anticipated total number of treatments of 16. Interventions to include e-stim/US as indicated, stretching/ROM/ strengthening exercises, patient education and home exercises. Next visit will initiate e-stim/US as indicated and exercises. A copy of this evaluation and plan of care will be sent to the referring clinician. If he/she has any questions or concerns I can be reached at ext: 47155

Document Text

PRINCIPAL DIAGNOSES:

1. Right knee MCL sprain.
2. Medial meniscal tear.
3. Significant chondromalacia patella.

James is a very pleasant 51-year-old male. He comes in with an initially a histrionic exam with pain essentially all over his knee. On further questioning, he reports he has been wearing his hinged knee brace. He also reports it is worn out, does not fit very well.

On clinical examination today, his MCL has some returning stability with decreased discomfort to valgus stress. He is still tender at the femoral origin, but otherwise appears to be doing better. His joint line is still tender to direct palpation, but his exam is somewhat histrionic and difficult to assess clinically. His range of motion is starting to stiffen. He has from 0 degrees to 115 degrees of flexion. In light of this, I have referred him to physical therapy for range of motion and strengthening exercises. He is to continue wearing his hinged knee brace, and I have refitted him for a new one today in the office. He will return to see me in one month's time for reassessment. At that point, we would further discuss surgery if indicated based on his meniscal pathology. Should he have further difficulties, he will follow up immediately.

### Document Text

PRINCIPAL DIAGNOSES: Right knee MCL tear with medial meniscal tear and rupture of Baker cyst, superimposed on the underlying degenerative chondromalacia with cartilaginous fissuring.

CLINICAL HISTORY: Mr. Rollins is a 51-year-old male who has been out of work for approximately 1 year. He apparently sustained a fall down a flight of steps with significant valgus stress to his knee. He subsequently was seen by Eric Diamond, who obtained an MRI and referred him to me for followup. On consultation with his MRI report, patient has complete transection of his MCL. In addition, he has evidence of posterior medial meniscal tear superimposed on chondromalacia of the patellofemoral joint and medial joint compartment with patellar fissuring. He also has evidence of a ruptured Baker cyst acutely. Mr. Rollins reports instability of his knee with any type of ambulation or pivoting or twisting. He also has developed a blister on the posterior medial aspect of his proximal tibia.

On clinical examination, he has gross instability to valgus stress. Lachman and posterior drawer are otherwise negative. He has joint line tenderness significantly medially in the area of the MCL as well as the medial meniscus. The lateral joint compartment is also tender but markedly less degree. There is mild swelling and effusion. Distally, he is neurologically intact. There is no edema or swelling. He has palpable pulses and brisk capillary refill.

We fitted Mr. Rollins for hinged knee brace, which he is essentially to wear 24 hours a day for the next 4 weeks. He will return to see me on a 4-week interval for repeat evaluation. I did review with him that it is entirely possible that he will get by a nonoperative fashion. However, should he remain markedly symptomatic, he may have to consider surgical intervention.
